This is a totally new vb6 templates that compatible to .Net Framework v4.0. Vb6tmpl Tlb Download Full 23 I have a new PC running Windows 7 and Visual Studio 2010, and need to register a legacy typelib (.tlb) to interface with an existing legacy application. A: I'm not sure, what you mean. An additional tlb needs to be registered for a COM component. Before registering it, all COM exports must be imported with the additional /tlb parameter. And what kind of component would need a tlb export? Does your legacy application provide a registered component? Does it look like this (its not a.tlb, but it might be) /COMServer("Q242724",1,1) { REGISTERCLSID("Product-Key-2012-work_N-easway",MSO_R" class RegClass : public CComObjectRootEx, public CComCoClass { // DECLARE_GET_CONTROLLING_UNKNOWN() }; CLASS_VERSION(RegClass,1) DECLARE_REGISTRY_APPID(appid) DEFINE_GUID("{8915AEA0-48AE-11CF-A2A0-0000F80849E3}", "Q242724", 0x0000, 0, 0, 0, 0, 0, 0x10, 0, 0x80, 0x4); DEFINE_GUID("{3624C8D0-E7C9-11D4-80A4-00500DC0CC88}", MSO_R" (ORCCTL{00000019,0164},{7A7C7C72-0051-11D1-99BC-00C04FECB822,123}) {4932,20061,101,1563});
