ExtFS is a reliable and able to work with all NTFS data at the.Various processes for producing petrochemicals from synthesis gas (syngas) have been developed for many years. Such processes include the Fischer-Tropsch process (FTP) developed by Robert H. Fischer and Franz O. Tropsch in Germany in 1925, and the Mobil process (MTP), and other processes, using the catalytic reforming of paraffinic hydrocarbons. The Fischer-Tropsch (FT) reaction converts synthesis gas (syngas) to liquid hydrocarbons using an iron-based catalyst, catalyst that can be coated on a variety of materials such as silica-alumina or titania. The FT catalytic reaction is shown in equation (1) below:
$$\text{CO} \rightarrow \text{C}_5 + 3\text{H}_2\text{O} \quad (1)$$
The Fischer-Tropsch reaction is still based on a catalytic reaction. The reaction is an equilibrium reaction and two out of the three reaction products are always by-products. As a result, the Fischer-Tropsch reaction tends to generate light hydrocarbons of C5 and lower molecular weights. In addition, the Fischer-Tropsch reaction produces some undesirable side reactions, such as the decomposition of paraffins and the polymerization of olefins to polymerize to form waxes and coke. A number of U.S. patents disclose processes for the conversion of a mixture of carbon monoxide and hydrogen to hydrocarbons. These patents include U.S. Pat.
