The purpose of this study was to determine if selected androgens (testosterone, 17 beta-estradiol, hydrocortisone, 5 alpha-dihydrotestosterone) influence the development of a seminiferous tubule culture system. Porcine seminiferous tubules from 13- to 14-week-old pigs were maintained for 5 days in organ culture, and effects of androgens were determined by histologic evaluation and tubular protein determination. Qualitative histologic evaluation demonstrated that seminiferous tubules were still in the spermatogenic process, but the stage-specific morphology of each tubule was no longer present. Furthermore, seminiferous tubule protein concentrations were undetectable. Moreover, androgen treatment failed to affect any parameter of seminiferous tubule cell function as assessed by measurements of lipid peroxide levels, lysosomal hydrolase activities, and granulocyte peroxidase generation. The results of this study indicate that the seminiferous tubule organ culture system is a useful tool for studying the effects of hormones on spermatogenesis, but that testosterone, 17 beta-estradiol, or hydrocortisone does not improve either elongation or differentiation of the seminiferous epithelium.Hamilton County single men We have all spent countless hours on dating websites browsing for that perfect guy: that could be me sooner than you think.
