This observation may reflect the circumstance that evaluations of risk perception accuracy in young children must be considered as conditional on their understanding of the presented risk scenarios and their ability to identify their personal risk for each scenario. In other words, in young children (and adults, too) risk perception accuracy is intimately related to whether they have developed any (or sufficiently developed) abilities to identify their personal risk from a given risk scenario. Fusing the two aspects -- the theoretical background and the empirical data -- is exactly what was achieved in this study. The study provides empirical evidence that shows that in school-aged children the risk perception accuracy of adults can only be observed in scenario-based assessments, if the children themselves are able to link their personal risk to the risk scenarios. The indirect questioning of risk perception accuracy via the "correctness to rule out risk" task differs from the common assessment of risk perception as the mere acceptance or rejection of a risk scenario and shows a more complex cognitive and motivational process in which risk-relevant information has to be evaluated and matched with personal risk in an adaptive task-dependent way. This is in line with theory, stating that generally people do not accept any risk as to be correct. This means that the key factor of the task-dependent matching is not risk acceptance but rather the correct identification of personal risk. As long as children are unable to correctly identify personal risk, the question is whether they correctly rule out risk. This is an important factor for interventions for dealing with risky health behavior because assessing the correctness to rule out risk clearly identifies children who are at risk for risky health behavior but have not yet reached the stage of "acceptance" of risk. Some limitations of the study have to be mentioned. First, the study was limited to school-aged children and only one task was used to explore the rationality of risk

deep into the gritty details of new releases. What's the point of making you wait when it's no fun anyway? These days, however, the hype train has moved on and the new Pixel 4 and Pixel 4 XL are going to be arriving in a couple of weeks. And as a preview of the design direction Google is taking with its second line of devices, there is much I want to talk about. But first, let's say a few words about the software and hardware. In the lead-up to yesterday's big announcement, I spent a good deal of time talking with the folks over at Google about what made it important to them to "resume" Android. More importantly, I spent time talking about how the simplicity of Android is something that Android fans have always

respected and admired. The Pixel 4 will be launching with Android 9.0 Pie and the Pixel range, including the Pixel 3 and Pixel 3 XL, will be launching with Android 10. Now, this shouldn't be seen as just something Google is doing for the sake of it. The Pixel 4 is a beta device, meaning that the software should be growing and improving for quite a few more months before release. At the same time, Android 10 is looking like one of the most significant updates ever, and that's not the case for all previous versions of Android. There was never a doubt in my mind that Google was moving away from the modular approach. No matter how good I think Google's decision making has been for Android,

the Pixel 3 XL and 3a had a very different ethos. There is no chance that Google will ever launch a new version of Android without Google Assistant. That's a fact. So now that we know what I think of this new direction, what do you think? Will the Pixel 4 and 4 XL continue the
